and to pharmaceutically acceptable acid addition salts thereof.

[0002] The compounds of formula I and their salts are characterized by valuable therapeutic properties. It has surprisingly been found that the compounds of the present invention are agonists and/or antagonists of the Orphanin FQ (OFQ) receptor. Consequently they will be useful in the treatment of memory and attention deficits, psychiatric, neu-

rological and physiological disorders, especially, but not limited to, amelioration of symptoms of anxiety and stress disorders, depression, trauma, memory loss due to Alzheimer's disease or other dementias, epilepsy and convulsions, acute and/or chronic pain conditions, symptoms of addictive drug withdrawal, control of water balance, Na<sup>+</sup> excretion, arterial blood pressure disorders and metabolic disorders such as obesity.

**[0003]** OFQ, a seventeen amino-acid-long peptide (F-G-G-F-T-G-A-R-K-S-A-R-K-L-A-N-Q), has been isolated from rat brain and is a natural ligand to a G-protein coupled receptor (OFQ-R), found at high levels in brain tissue.

**[0004]** OFQ exhibits agonistic action at the OFQ-R both in vitro and in vivo.

**[0005]** Julius (Nature 377,476, [1995]) discusses the discovery of OFQ noting that this peptide shares greatest sequence similarity with dynorphin A, an established endogenous ligand for opioid receptors. OFQ inhibits adenylate cyclase in CHO(LC 132+) cells in culture and induces hyperalgesia when administered intra-cerebroventricularly to mice. The pattern of results indicate that this heptadecapeptide is an endogenous agonist of the LC 132 receptor and it appears to have pro-nociceptive properties. It was described that when injected intra-cerebroventricularly in mice, OFQ slowed down locomotive activity and induced hyperalgesia. It was concluded that OFQ may act as a brain neurotransmitter to modulate nociceptive and locomotive behavior.

**[0006]** Objects of the present invention are the compounds of formula I and pharmaceutically acceptable addition salts thereof, racemic mixtures and their corresponding enantiomers, the preparation of the above-mentioned compounds, medicaments containing them and their manufacture as well as the use of the above-mentioned compounds in the control or prevention of illnesses, especially of illnesses and disorders of the kind referred to earlier, or in the manufacture of corresponding medicaments.

10 [0020] The present compounds of formula I and their pharmaceutically acceptable salts can be prepared by methods known in the art, for example, by processes described below, which comprise

a) reductively aminating a compound of formula

15

20

with a compound of formula

25

30

35

or, if desired, adding KCN to the mixture of a compound of formula II and III to get a compound of formula I, wherein  $R^4$  is hydrogen or nitrilo, respectively, and wherein A and  $R^1$ - $R^3$  have the significances given above, or  
b) cyclizing and reducing a compound of formula

40

45

to give a compound of formula

50

55

wherein A and R<sup>1</sup> have the significances given above, or  
c) reacting a compound of formula

with a compound of formula

wherein R<sup>3</sup> is described as above, but different from hydrogen and X is halogen, to give a compound of formula

or

- d) alkylating or benzylating a compound of formula I, wherein R<sup>3</sup> is hydrogen, and, if desired,
- e) converting a racemic mixture into its enantiomeric component thus obtaining optically pure compounds, and/or, if desired,
- f) converting the compound of formula I obtained into a pharmaceutically acceptable acid addition salt.

**[0021]** In accordance with process variant a) the reductive amination of a keto compound of formula II with an amine of formula III is carried out in conventional manner in a solvent, such as toluene, tetrahydrofuran (THF), methanol or ethanol, or in a mixture of THF with a suitable alcohol, and in the presence of a reducing agent such as Na-cyanoborohydride, or in the presence of KCN, respectively.

**[0022]** Another method for a reductive amination is described in J. Org. Chem., 55, 2552-54, 1990. In accordance with this variant the reaction is carried out by reaction of an amine with a ketone in the presence of Ti-(IV)-isopropoxide and Na-cyanoborohydride.

**[0023]** The cyclisation in accordance with process step b) can be carried out in conventional manner, for example with formamide at a temperature of about 200 °C or with formic acid ortho esters at a temperature of about 150 °C. Unsaturated products can be converted to the saturated compounds by reduction, for example with sodium cyanoborohydride.

**[0024]** A compound of formula I can further be prepared by reacting a compound of formula I-1 with a compound of formula R<sup>3</sup>X in accordance with reaction step c). This reaction is carried out in a suitable solvent, such as DMF, and

in the presence of sodium hydride at room temperature. Suitable halogenides of formula  $R_3X$  are chlorides, bromides and iodides, such as methyl iodide, bromomethyl acetate, N,N-dimethyl-chloroacetamide or ethyl-5-bromovalerate. The reaction time is about 18 h.

[0025] In accordance with process variant d) a compound of formula I, wherein  $R^3$  is hydrogen, can be alkylated or benzylated in conventional manner, for example in the presence of a corresponding alkyl- or benzyl halogenide, such as methyl iodide, ethyl iodide, benzyl bromide, 3-phenyl-1-propyl bromide or 3,3-diphenyl-1-propyl bromide. This reaction is carried out in the presence of a metal hydride, such as sodium hydride at a temperature of about 60-100 °C.

[0026] Racemic mixtures can be converted into its enantiomeric components in conventional manner, for example by preparative HPLC.

[0027] The salt formation in accordance with variant f) is effected at room temperatures in accordance with methods which are known per se and which are familiar to any person skilled in the art. Not only salts with inorganic acids, but also salts with organic acids come into consideration. Hydrochlorides, hydrobromides, sulphates, nitrates, citrates, acetates, maleates, succinates, methanesulphonates, p-toluenesulphonates and the like are examples of such salts.

[0028] The compounds of formulae II and III which are used as starting materials are known compounds or can be prepared by methods known per se.

[0029] For example, the ketons of formula II can be prepared by methods, described in Beilstein H7, E17, E117, E1117 and E1V7. Compounds of formula III are described, for example, in US 3,238,216, US 3,161,644, US 3,155,670 and US 3,155,669.

[0030] Schemes 1 and 4 describe the reductive amination in accordance with process variant a).

Scheme 1

wherein A' is a compound of group A having a partially unsaturated ring (one double bond) and A and  $R^1$ - $R^3$  have the significances given above.

Scheme 2 shows a process for the preparation of compounds of formula I-1.

Scheme 2

R<sup>1</sup> and A have the significances given above.

The starting materials of formulae VI and VII are known compounds or can be prepared according to methods known in the art, for example compounds of formula VI can be prepared in accordance with Beilstein H12, EI12, EII12, EIII12 and EIV12. Compounds of formula VII can be prepared by methods described in Tschaen et al., J.Org.Chem., 60, 4324 (1995).

In scheme 3 it is described the cyclization of compounds of formula IV to a compound of formula X and then to a compound of formula I-2. In this scheme the substituents are as described above. The starting materials of formula IV are known compounds or can be prepared by methods known in the art.

Scheme 3

In the following scheme 4 is described the process for preparation of compounds of formula I, wherein A is cyclohexyl, optionally substituted by (C<sub>1-6</sub>) alkyl, C<sub>5-7</sub>-cycloalkyl, spiro-undecan-alkyl or 2-norbornyl and R<sup>4</sup> in this scheme is (C<sub>1-6</sub>) alkyl.

Scheme 4

It has been found that the compounds of the present invention are agonists and/or antagonists of the OFQ receptor and have effects in animal models of psychiatric, neurological and physiological disorders, such as anxiety, stress disorders, depression, trauma, memory loss due to Alzheimer's disease or other

**[0032]** The compounds were investigated in accordance with the tests given hereinafter:

## 5 Methods of OFQ-R Binding Assay

### Cell Culture

**[0033]** HEK-293 cells adapted to suspension growth (293s) were cultured in HL medium plus 2% FBS. The cells were transfected with the rat OFQ receptor cDNA (LC132), FEBS Lett. 347, 284-288, 1994, cloned in the expression vector pCEP4 (Invitrogen, San Diego, CA, USA) using lipofectin (Life Technologies, Bethesda, MD, USA). Transfected cells were selected in the presence of hygromycin (1000 U/ml) (Calbiochem, San Diego, CA, USA). A pool of resistant cells was tested for OFQ-R expression by binding of [<sup>3</sup>H]-OFQ (Amersham PLC, Buckinghamshire, England). These cells (293s-OFQ-R) were expanded for large scale culture and membrane preparation.

### 15 Membrane preparation

**[0034]** 293s-OFQ-R cells were harvested by centrifugation, washed 3 times with phosphate buffered saline (PBS) before resuspension in buffer A (50 mM Tris-HCl, pH 7.8, 5 mM MgCl<sub>2</sub>, 1 mM EGTA) and disruption with a tissue homogenizer (30 seconds, setting 4, Pt 20, Kinematica, Kriens-Lucern, Switzerland). A total membrane fraction was obtained by centrifugation at 49,000 x g at 4°C. This procedure was repeated twice and the pellet was resuspended in buffer A. Aliquots were stored at -70°C and protein concentrations were determined using the BCA™ Protein Assay Reagent (Pierce, Rockford, IL) following the manufacturer's recommendations.

**[0035]** Binding Assays [<sup>3</sup>H]-OFQ competition studies were carried out with 77 µg membrane protein in a final assay volume of 0.5 ml buffer A plus 0.1% BSA and 0.01% bacitracin (Boehringer-Mannheim, Mannheim, Germany) for one hour at room temperature. 50 nM unlabeled OFQ was used to define the non-specific binding. The assays were terminated by filtration through Whatman GF/C filters (Unifilter-96, Canberra Packard S.A., Zurich, Switzerland) pretreated with 0.3% polyethylenimine (Sigma, St. Louis, MO, USA) and 0.1% BSA (Sigma) for 1 hour. The filters were washed 6 times with 1 ml of ice cold 50 mM Tris-HCl pH 7.5. The retained radioactivity was counted on a Packard Top-Count microplate scintillation counter after addition of 40 µl of Microscint 40 (Canberra Packard). The effects of compounds were determined using at least 6 concentrations in triplicate, and determined twice. IC<sub>50</sub> values were determined by curve fitting and these values were converted to K<sub>i</sub> values by the method of Cheng and Prusoff, Biochem. Pharmacol., 22, 3099, 1973.

**[0035]** The affinity to the OFQ-receptor, given as pK<sub>i</sub>, is in the scope of 6,2 to 10,0. For example, the pK<sub>i</sub> -values of Examples 13 and 21 are 8,4 and 9,5, respectively.

13 Mixture of cis- and trans-1-phenyl-8-(4-propyl-cyclohexyl)-1,3,8-triaza-spiro[4.5]decan-4-one

21 8-(Decahydro-naphthalen-2-yl)-3-methyl-1-phenyl-1,3,8-triaza-spiro[4.5]decan-4-one

**[0036]** The compounds of formula I as well as their pharmaceutically usable acid addition salts can be used as medicaments, e.g. in the form of pharmaceutical preparations. The pharmaceutical preparations can be administered orally, e.g. in the form of tablets, coated tablets, dragées, hard and soft gelatine capsules, solutions, emulsions or suspensions. The administration can, however, also be effected rectally, e.g. in the form of suppositories, or parenterally, e.g. in the form of injection solutions.

**[0037]** The compounds of formula I and their pharmaceutically usable acid addition salts can be processed with pharmaceutically inert, inorganic or organic excipients for the production of tablets, coated tablets, dragees and hard gelatine capsules. Lactose, corn starch or derivatives thereof, talc, stearic acid or its salts etc can be used as such excipients e.g. for tablets, dragées and hard gelatine capsules.

**[0038]** Suitable excipients for soft gelatine capsules are e.g. vegetable oils, waxes, fats, semi-solid and liquid polyols etc.

**[0039]** Suitable excipients for the manufacture of solutions and syrups are e.g. water, polyols, saccharose, invert sugar, glucose etc.

**[0040]** Suitable excipients for injection solutions are e.g. water, alcohols, polyols, glycerol, vegetable oils etc.

**[0041]** Suitable excipients for suppositories are e.g. natural or hardened oils, waxes, fats, semi-liquid or liquid polyols etc.

**[0042]** Moreover, the pharmaceutical preparations can contain preservatives, solubilizers, stabilizers, wetting agents, emulsifiers, sweeteners, colorants, flavorants, salts for varying the osmotic pressure, buffers, masking agents or antioxidants. They can also contain still other therapeutically valuable substances.

[0043] The dosage can vary within wide limits and will, of course, be fitted to the individual requirements in each particular case. In general, in the case of oral administration a daily dosage of about 10 to 1000 mg per person of a compound of general formula I should be appropriate, although the above upper limit can also be exceeded when necessary.

40 (R,S)-8-Cyclodecyl-1-phenyl-2-methyl-1,3,8-triaza-spiro[4,5]decan-4-one hydrochloride (1:1)

45 [0097] 8-Benzyl-1-phenyl-1,3,8-triaza-spiro[4,5]dec-2-en-4-one (1 g, 3.2 mMol) and some crystals of Cu(I)-chloride was dissolved in 50 ml dry THF and methyl-magnesiumchloride (2.1 ml of a 3M solution in THF) was added dropwise. The reaction was stirred at RT until the TLC showed the absence of starting-material. To the reaction mixture was added 50 ml of a saturated ammoniumchloride solution and stirred for 30 minutes. Then the layers were separated and the aqueous layer was extracted three times with ethyl-acetate. The combined organic layers were dried over sodium sulfate, filtered and evaporated to give 1.05 g of (R,S)-8-benzyl-2-methyl-1-phenyl-1,3,8-triaza-spiro[4,5]decan-4-one as slight yellow glass, m.p. 64.3-65.8 °C, suitable clean for the next step.

[0098] 1.05g of this compound was dissolved in 30 ml methanol, 300 mg of Pd/C 10% was added and a balloon with hydrogen was attached. When TLC indicated the absence of starting material, the reaction mixture was filtered and evaporated to yield 617 mg of 2-methyl-1-phenyl-1,3,8-triaza-spiro[4,5]decan-4-on as a slightly yellow foam. MS: 246 (M+H<sup>+</sup>), suitable clean for the next reaction.

55 [0099] 617 mg of this compound were dissolved in THF and 2.2 ml tetraisopropylortho-titanate and 2.8 mmol cyclodecanon was added. After 18 h at roomtemperature, the mixture was evaporated and the residue dissolved in ethanol and 2.5 mMol of sodiumcyanoborohydride was added. After 18 h at room-temperature, water and ethyl acetate was added, the layers separated and the organic layer washed with 2N aqueous sodium hydroxide solution and brine.

The organic layer was dried over sodium sulfate, filtered and evaporated. Chromatography on silica-gel (ethyl-acetate) yielded the desired product which was crystallized as its hydrochloride salt from methanol/ether. 41 mg of (R,S)-8-Cyclodecyl-1-phenyl-2-methyl-1,3,8-triaza-spiro[4,5]decan-4-one hydrochloride (1:1) as an off-white powder, m.p. >250 °C, MS: m/e = 384 ( (M+H)<sup>+</sup>).
